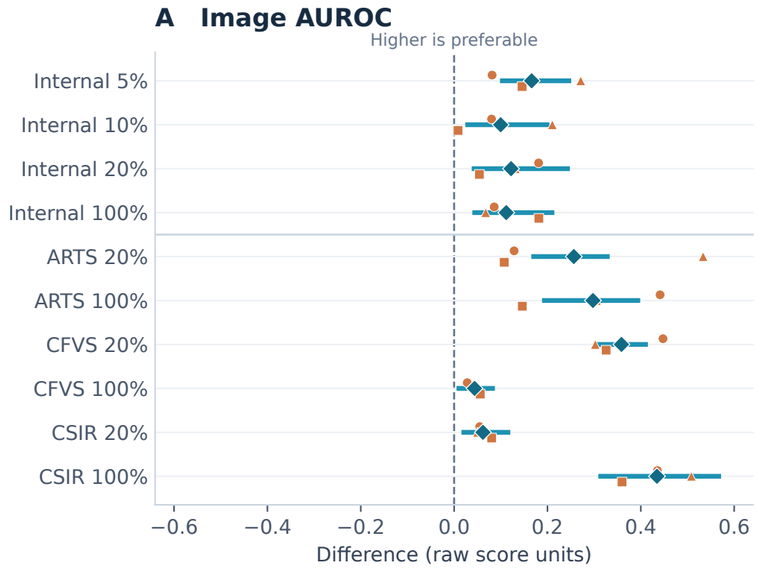
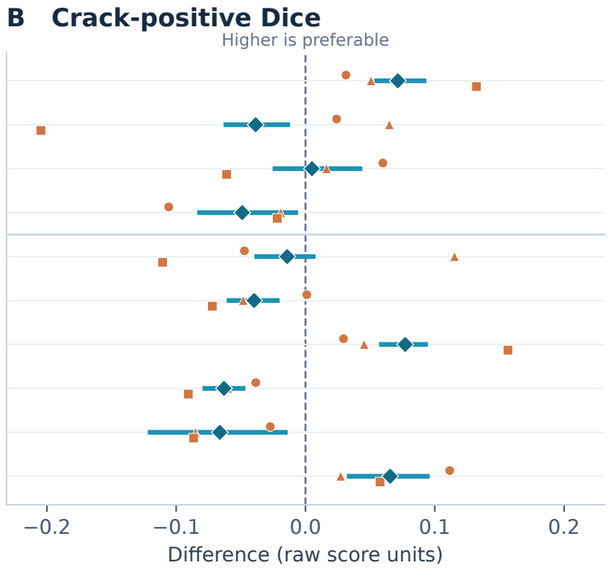
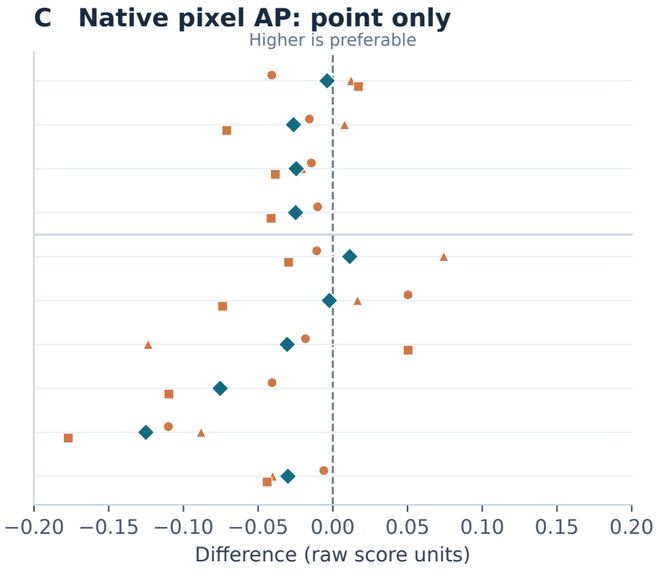
03 | Where LoRA helps - and where it costs

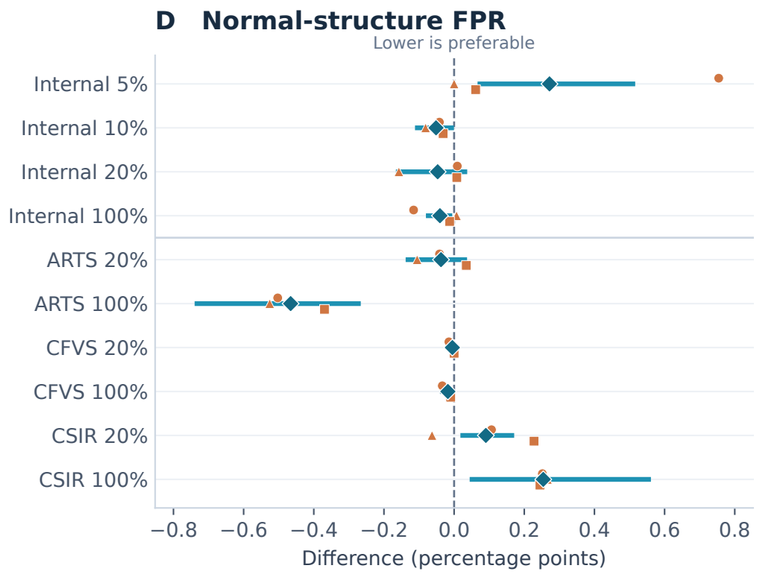
DINOv3 LoRA minus adapted CNN, every completed source cell; the displayed contrast is one of 62 saved comparisons

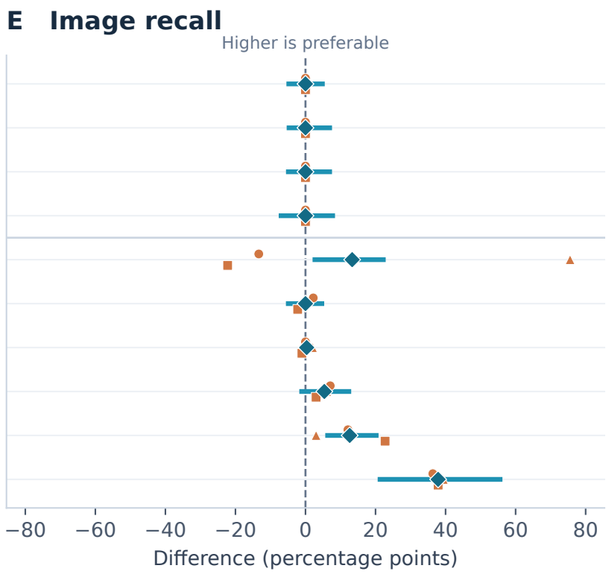
Saved mean and conditional 95% interval Three paired-seed differences

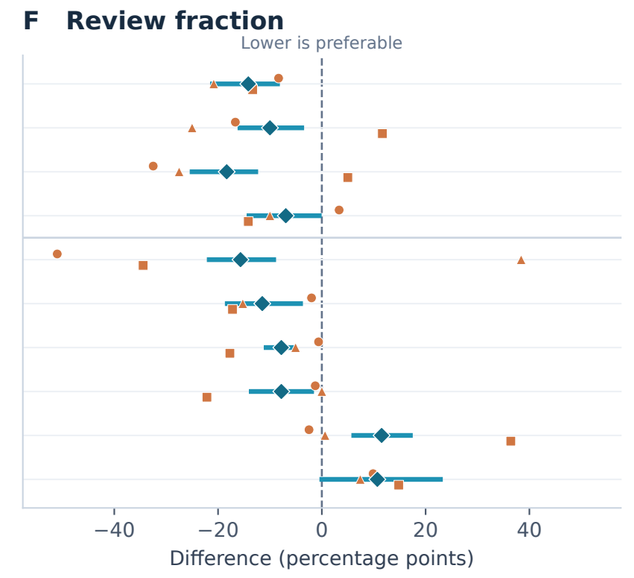












Intervals are retrospective, conditional on fitted systems, and unadjusted across comparisons. Seed markers show training variation, not a CI.

Native AP has no pixel-bootstrap interval. FPR / recall / review axes show percentage-point changes; saved CSV/JSON preserve raw ratios.

Lower review must be read together with recall. This is a complete ten-cell source contrast, not an interim confirmation-performance conclusion.
